NG3 protease (Fragment).
Hepatitis C virus.
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN BYNUELOPE. CONSISTS OF TWO PROFINS: PROFIEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ċ

BJ001625 MF01SSA cDNA Oryzias latipes cDNA clone MF01SSA025C02 5', mRNA sequence.
Non-normalised library, directionally cloned into pspoRTI. Derived from maternal Lisaue disserted from developing grains. (8 days post anthesis) in glasshouse grown barley plants. Developed as part of the barley transcriptome resources of BBSRC/SERRAD funded cereal IGF (Investigating Gene Punction) profect.

clone_lib_"Hordeau vulgare seedling shoot EST library vcDNA002 (Dehydration stress)*

**NEDNA002 (Dehydration stress)**

**NEDNA002 Sterilized then germinated under axenic enditions in the dark at room temperature on filter paper ith water, nystain axenic deformed in covered contains at 100 RH for 24 hr. Shoots were then harvested, otal IRA was prepared, Dely(A) RNA was putified, one rimary unamplified CDNA library was made, 600000 pfu were rivo excised to give pBluescript SK(-) CDNA phagemids, hese steps were performed in the TJ Close laboratory at the University of Callfornia, Riverside (Choi, Close, enton). Phagemids were plated and picked at the Clemson niversity Genomics Institute (CUGI) (Begum, Palmer, risch, Atkins and Wing), Plasmid DNA preparations, DNA equencing and sequence analysis were performed at CUGI wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence have been trimmed to remove vector sequence.

**Part of the contains a minimum of 100 bases of phred value 20 or bover.**
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AGGTGGCCGCGGTGGACGGCGCGCGGGAGGGAAGCGGCTCGTGGTCG 168

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treamments of HCV infection. This is useful as HCV can load to chook it invention concerns a number of NS3 mutants and NS3-NS4A
                                                                                                                                                                                                                                                                                                                                                        9

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the antiviral treatments of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the involutions of the section. This is useful as HCV an lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   119 LVTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVCTRGVAK 178

                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                        The present sequence is a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antivizal treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HVV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the vinfection. This is useful as HCV can lead to chronic liver disease such as cirthosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and

                                                                                                                                                                                                                                                                                                                                                                                                                                                             ŏ
                                                                                                                     The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: This sequence contains the alpha-helix0 wild-type sequence.

```
The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-liveriant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              118
